

Cumbria Weather Report - The Year 2023
Very Warm and at some sites, the warmest year recorded
Wetter than average, but with an uneven distribution throughout the year - wettest since 2020.
Whilst 2022 was the warmest year on record across the whole of Cumbria, 2023 has managed to be even warmer at a few sites; although the general pattern for 2023 was slightly less warm than that of 2022. The warmest year on record went to sites such as Shap and Maulds Meaburn, in the central eastern portion of the county, where it finished $0.1^{\circ} \mathrm{C}$ warmer than last year.
However, with a mean temperature of $11.16^{\circ} \mathrm{c}$, Walney also recorded its highest ever annual mean temperature, surpassing that of 2022 by just $0.04^{\circ} \mathrm{c}$.
Just as importantly though, that mean temperature of $11.16^{\circ} \mathrm{c}$ is provisionally the warmest ever recorded in Cumbria.
Walney followed the UK trend for the greatest positive anomalies of temperature being found in the far west.
At Shap the three months to finish colder than average only did so by small margins, but of the nine to finish warmer than average two did so by at least $2.0^{\circ} \mathrm{c}$, four by $1.5^{\circ} \mathrm{c}$.
2023 was generally in the region of $0.8^{\circ} \mathrm{c}$ warmer than average, but with a wide variation from the $0.29^{\circ} \mathrm{C}$ above average at Ambleside to the $1.11^{\circ} \mathrm{C}$ at Walney.

Unlike the record breaking heat-wave of July 2022, the summer of 2023 was generally quite poor - even though it had got off to great start in June.
This year the warmest temperatures were to be found in June and September!
June saw the river Derwent in the Borrowdale valley run dry and the warmth and dryness of the month, especially in the first half, was more than notable.
A temperature of $31.1^{\circ} \mathrm{c}$ was recorded at Seaton (near Workington) and which would be the year's highest.
And then September! Whilst only Warcop $6^{\text {th }}-8^{\text {th }}$, Keswick $4^{\text {th }}-9^{\text {th }}$ and Levens $4^{\text {th }}-8^{\text {th }}$ achieved 'heat-wave' status, many stations were warm if not very warm, but failed to get three consecutive days above 25 c - however, with some very large daily rainfall totals the month would also finish very wet and included a notable thunderstorm on the $10^{\text {th }}$ that caused some flooding.
It was as much the consistency of warmth that stood out in 2023 and in some ways best illustrated by Walney recording a mean temperature over $16^{\circ} \mathrm{c}$ in the four consecutive months of June to September. This year the lowest temperature would not be recorded at Shap, but at Grisedale on the $17^{\text {th }}$ January; its $-10.6^{\circ} \mathrm{c}$ only just lower than the $-10.5^{\circ} \mathrm{c}$ recorded at Shap on the $8^{\text {th }}$ March.

2023 was the wettest year since 2020 with rainfall totals broadly finishing in the range of $110-120 \%$ of the LTA.
Generally, when expressed as a percentage of the LTA, it was driest in the north-western coastal areas of the county and wettest in the far south of the county.
However, Aisgill in the south-east of the county finished with a total exactly on average whilst in those wetter locations totals of just over $120 \%$ were more wide-spread and attained $131.9 \%$ at Mickleden in the Langdale Valley (south Lakes).
The highest annual rainfall total is only ever going to come from a handful of sites and this year of the four sites to top the 4000 mm mark (157.5 In) Honister with 4435.6 mm (174.6 In) was the wettest. As for the driest location, the caveat is, without access to all records and some such as Kirkby Thore (the driest part of Cumbria) having incomplete data, we cannot be entirely certain.
However, provisionally it would appear that nowhere recorded less than 1000 mm (39.37 In). Both Brampton and Thursby just scraped over the mark and had it not been for missing data in December, Carlisle would potentially have been even closer to the 1000 mm mark.

This report should be used in conjunction with the monthly editions of the CWR.

## Station Notes

Ambleside - Rainfall was $2626.9 \mathrm{~mm} 3^{\text {rd }}$ Wettest Year on record

Appleby in Westmoreland -1090.8 mm is $121.7 \%$ of average for the period 1857-2020.
Wettest since $2020--18^{\text {th }}$ wettest in that time
Brampton $-3{ }^{\text {rd }}$ warmest on record and slightly wetter than normal.
Mean temperature of 10.00 c (average is 9.40 c )
There was 35 Air Frosts and 84 Grass Frosts
Total rainfall was 1017.3 mm or $104.5 \%$.
Wettest Day was $8^{\text {th }}$ July with 29.4 mm .
No days with Fog at 0900 !!
Total Sunshine was 1298.4 hrs or $104.1 \%$

Carlisle - Mean temperature +0.88 c above normal.
Coniston - $3344.7 \mathrm{~mm} 3^{\text {rd }}$ wettest year on record.
Ennerdale Black Sail - 4373.8 mm is $111.2 \%$ of its average (2000-21)
Wettest since 2020 -- 18 have been drier and five wetter
Grasmere - Total rainfall $=3118.9 \mathrm{~mm}$

Maulds Meaburn - Mean temperature of $9.67^{\circ} \mathrm{c}$ is $0.82^{\circ} \mathrm{c}$ above the 14 yr average for this site. The warmest yet recorded - beats 2022 by $0.07^{\circ} \mathrm{C}$ Rainfall of 1359.5 mm is $108.9 \%$ of average (2009-2022) -- Wettest since 2020 Eleven have been drier and four wetter. No. of rain days (225) is 10.2 above average 49 air frosts is 9.2 below average -- 104 ground frosts ( 14.7 below average) 38 days attained $20^{\circ} \mathrm{c}+$ (2.3 above average) and 10 days attain $25^{\circ} \mathrm{c}$ (4.6 above). Seven days of lying snow is 3.8 below average.

Scotby - 2023 was a warmer than average year, very similar to 2022 and 2014.
The mean annual temperature for each year was 10.6 C and the mean maximum was 14.8 C .
During 2023 only July and November had average temperatures cooler than normal, whereas May and June were well above the normal.
The total rainfall for 2023 was 942.9 mm ( 37.1 inches).
This was a wetter year than the previous two years but was almost exactly the same as the average for Scotby over the last 37 years.
July was much wetter than normal and May was much drier, with the other months not Deviating too far from the average.

Seathwaite Farm - 4233.6 mm is $125.6 \%$ of average for 1845-2020 Wettest since 2020 -- the $13^{\text {th }}$ wettest year

Shap - Mean temp of $8.86^{\circ} \mathrm{c}$ is $+0.85^{\circ} \mathrm{c}$ warmer than average and makes 2023 the warmest year yet in its Records - beating 2022 by 0.1c
Rainfall of 2044.2 mm is $111.1 \%$ of average
In a record from 1989 it is the wettest since 2020 -- 26 have been drier and eight wetter 61 air frosts is 10 below average.

## Notable events in 2023:

- $12^{\text {th }}$ February - rainfall of 118.6 mm at Honister
- Drought from mid May to Mid June that saw some rivers run dry
- Thunderstorm of $10^{\text {th }}$ September which caused some flooding and included 24.2 mm of rain being recorded in a 15 minute period at Dubbs Reservoir
- $19^{\text {th }}$ September - rainfall of 117.0 mm at Honister
- $5^{\text {th }}$ October - the greatest 24 Hr rainfall total of the year, 132.0 mm , recorded at Ennerdale Black Sail
- $13^{\text {th }}$ November - rainfall of 124.2 mm at Honister
- $2^{\text {nd }}$ December - snowfall event in south Cumbria that saw some locations with snow laying to a depth in excess of 30 cms ( 1 Ft )
- $17^{\text {th }}$ December - rainfall of 110.4 mm at Ennerdale Black Sail

Away from the LDNP the greatest 24Hr rainfall total was recorded at Appleby In Westmorland on $10^{\text {th }}$ September, 63.6 mm

Thursby has been used instead of Carlisle which unfortunately had incomplete data in December and hence it wasn't possible to provide an annual total. At the end of November Carlisle had had 902.2 mm compared to Thursby's 916.1 mm

Some other stations that had incomplete records for the year and which I would have used for this report were Keswick and Barras

The following is a breakdown of the weather in 2023 at ... Shap
